Codul de diagnostic/Categoria majora de diagnostic (CMD)/Index DRG

Aceasta anexa listeaza fiecare cod de diagnostic ICD-10-AM folosit pentru a defini DRG-urile când codul apare fie ca diagnostic principal fie ca un diagnostic aditional (secundar). Totusi, sunt exceptii codurile de diagnostic ce apar în functiile ‘Problema majora’ si ‘Probleme majore multiple’ pentru nou-nascuti (listate la sfarsitul CMD 15 din Volumul 2).

Cel mai simplu tip de diagnostic care este listat în aceasta anexa este cand sunt listate pentru un cod numai DRG-uri dintr-un grup de DRG (GDRG) .

In unele cazuri DRG-urile de la doua sau mai multe GDRG, dar numai un CMD, sunt listate pentru un cod. Aceasta se produce de obicei cand diagnosticul este folosit pentru a defini divizarea dupa severitate a unui GDRG chirurgical, cand codurile de diagnostic adauga specificitate definitiei GDRG astfel incat o inregistrare este alocata corect unuia din mai multe DRG-uri chirurgicale sau cand CMD este 18 sau 21 iar diagnosticul este folosit pentru a defini HIV sau DRG-uri pentru multiple traume ca si DRG-urile medicale in aceste CMD-uri.

Trauma multipla este mai dificil de determinat decat alte alocari de CMD. Considerati un pacient cu un diagnostic principal S82.0 *Fractura de rotula* si cu diagnostice aditionale S37.01 *Contuzie si hematoma al rinichiului*, S36.83 *Leziune a retroperitoneului*, S83.6 *Dislocare si intindere a altor parti si nespecificate ale genunchiului* si S22.42 *Fracturi multiple de coasta implicand doua coaste*. Listarea pentru diagnosticul S82.0 este

Cod	CMD
S82.0	08
	21

Examinarea listelor traumei multiple in definitiile DRG pentru CMD 21 (Volumul 2) arata ca S37.01 este pe lista pentru a arata trauma rinichiului, iar S36.83 este pe lista pentru a specifica trauma coloanei vertebrale sau pelvisului. Aceasta inseamna ca inregistrarea ar fi alocata mai degraba la trauma multipla in CMD 21 decat la un DRG in CMD 08.
